Internal Combustion Engine Free An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine. Internal combustion engine - Wikipedia A free-piston engine is a linear, 'crankless' internal combustion engine, in which the piston motion is not controlled by a crankshaft but determined by the interaction of forces from the combustion chamber gases, a rebound device (e.g., a piston in a closed cylinder) and a load device (e.g. a gas compressor or a linear alternator). Free-piston engine - Wikipedia Spanish researchers design a CO₂-free internal combustion engine. Researchers from the Technical University of Valencia (UPV) have designed a new internal combustion engine that neither emits damaging gases nor CO₂. It is also highly efficient and complies with the 2040 emissions regulations. Spanish researchers design a CO₂-free internal combustion ... Researchers from Valencia's Polytechnic University (UPV) have designed a new internal combustion engine that does not generate carbon dioxide (CO₂) or gasses that are harmful to people's health. According to its creators, it is a revolutionary engine that meets the regulation on emissions planned for 2040 and also has high efficiency. New internal combustion engine that does not emit

The first practical and usable gas internal-combustion engine was designed by the French mechanical engineer E. Lenoir in 1860. In 1876 the German inventor N. Otto built an improved four-stroke gas engine. An internal-combustion engine is simpler than a steam engine, since one stage of power conversion—the steam-boiler system—is eliminated.
