Suppose that X is a topological space, f is a real valued function on X , and c is a real number. Then we will denote by $X \leq c$ the subspace of points x in X such that $f(x) \leq c$. The fundamental problem of Morse theory is to study the topological changes in the space $X \leq c$ as the number c varies. [WorldCat.org] Classical Morse theory is concerned with the critical points of a class of smooth proper functions f from a manifold Z to the real numbers, called Morse functions. For our generalization, we will let Z be a closed Whitney stratified space in some ambient smooth manifold M . We will need analogues for the notions of smooth function, critical point, and Morse function for this setting. Morse Functions and Nondepraved Critical Points | SpringerLink [DK02]
